Exhibit 13a Origin and breeding history of LH-1 a dent corn inbred.

The following is a chronological history of the breeding of the line LH-1. All work occurred at the Holden's Foundation Seed, Inc., Williamsburg, Iowa 52361

1965. A single cross was made between B37 female parent and 644 male parent. The B37 is a well-known inbred line developed in the public sector. 644 is a private line of Holden's not related to any line.

1966. Pollen parent B37 was crossed onto (B37 x 644) ear parent from the previous generation.

1967. Selected kernels from the previous generation were planted out and all self pollinated. Row 4348 page 83, 1967 Nursery Notebook.

1968. Selected ears from the previous generation were planted in ear-to-row fashion and all were self pollinated. One row among others was selected as having favorable plant type. Row 1793 page 41, 1968 Nursery Notebook.

1969. Selected ears from the previous generation were planted in ear-to-row fashion and all were self-pollinated. One row among others was selected as having favorable plant type. Row 691, Page 16, 1969 Nursery Notebook. At this stage and each successive generation, candidate lines were crossed onto yield tester lines for measuring their yield potential.

1970. Selected ears from the previous generation were planted in ear-to-row fashion and all were self-pollinated. One row among others was selected as having favorable plant type. Row 2965, Page 69, 1970 Nursery Notebook.

1971. Selected ears from the previous generation were planted in ear-to-row fashion and all were self-pollinated. One row among others was selected as having favorable plant type. Row 4012, Page 83, 1971 Nursery Notebook.

1972. Selected ears from the previous generation were planted in ear-to-row fashion and all were self-pollinated. One row among others was selected as having favorable plant type. Row 4871, Page 103, 1972 Nursery Notebook.

1973. Selected ears from the previous generation were planted in ear-to-row fashion and all were self-pollinated. One row among others was selected as having favorable plant type. Row 5042, Page 100, 1973 Nursery Notebook.

1974. The finished line from 1973 above was increased and selected with special attention to uniformity of the plant and ear type.

Summary: The line LH-1 was produced by crossing B37 x 644 then backcrossing to B37. Seven generations of selfing and selection for plant type yield an essentially homozygous line.

INSTRUCTIONS

GENERAL: Send an original copy of the application, exhibits and $250.00 fee to U.S. Dept. of Agriculture, Agricultural Marketing Service, Grain Division, 6525 Belcrest Road, Hyattsville, Maryland 20782. (See Section 180.175 of the regulations and rules of practice.) Retain one copy for your files. All items on the face of the form are self-explanatory unless noted below.

ITEM

5 Insert the date the applicant determined that he had a new variety based on the definition in Section 41 (a) of the Act and decision is made to increase the seed.

13a First, give the genealogy, including public and commercial varieties, lines, or clones used, and the breeding method. Second, give the details of subsequent stages of selection and multiplication. Third, indicate the type and frequency of variants during reproduction and multiplication and state how these variants may be identified. Fourth, provide evidence on stability.

13b First, give any special characteristics of the seed and of the plant as it passes through the seedling stage, flowering stage and the fruiting stage. Second, describe the mature plant and compare it with a similar commercial variety grown under the same conditions, and indicate the differences.

13c A supplemental form will be furnished by the PVPO to describe in detail a variety for each kind of seed.

13d Provide complete data indicative of novelty. Seed and plant specimens or photographs of seed and plant comparisons clearly indicating novelty may be submitted. Seeds submitted may be sterile.

13e Indicate whether applicant is the actual breeder, the employer of the breeder, the owner through purchase or inheritance, etc.

Botanical description of the variety

LH1 is a yellow dent corn inbred. The line is most similar to B37 in plant and ear type but is significantly shorter and lower eared. Hybrids with this line, substituted for B37, are shorter, lower eared and generally have more uniformity and late health.

The stalk of LH1 is of average strength and the roots are fair. Generally, under normal conditions the line has no tillers. Fourteen leaves are normal and are oriented from 30-60 degrees from horizontal. The leaves are separated by relatively short internodes. The anthers are red and extrude from a green glume with red points of dehiscment. The ear is medium in length and has average taper; it is attached to a strong shank of medium length and has a short husk extension. The kernals are arranged in 16 slightly curved rows. The kernel is thick, dark yellow with a bright yellow cap.

Data Indicative of Novelty

Novelty is based on the following characters:

LH1 most closely resembles B37 except it is (1) an average of 20% shorter, (2) has a lower ear height by an average of 30%, (3) it restores C cytoplasm nearly 100% while B37 does not restore.

Silking date is approximately the same but there is some indication that LH1 will dry slightly faster, at least to the 25% moisture level.
